

L12

1

Moment of Inertia:

The product of mass & square of the distance from the axis of rotation is

called moment of Inertia.
• It is denoted by 'I'.

$$I = mr^2$$

• Its unit is kgm^2

Explanation:

Consider a body of mass 'm', connected with a massless rod at point 'O' as shown.

A force on a mass it will acc

Know

$$F = m$$

• As force will rotate

Circular pa

the tange

related w

acceleration

$$a_r = r\alpha$$

put (2) in

$$F = m$$

multiply

$$rF = m$$

as we know

r

of mass &
ma from
ion is
of Inertia.
ed by 'I'.

gm²
body of mass
with a massless
'O' as shown.

2
A force 'F' is applied
on a mass 'm' so
it will accelerate as we
know

$$F = ma \rightarrow (1)$$

As force applied it
will rotate along a
circular path as we know
the tangential acceleration
related with angular
acceleration so

$$a_t = r\alpha \rightarrow (2)$$

put (2) in (1) we get

$$F = mr\alpha$$

multiply both side with 'r'

$$rF = mr^2\alpha$$

as we know that $rF = \tau$ &
 $mr^2 = I$

3
So $\tau = mr^2\alpha$
 $\tau = I\alpha$

Significance:

Moment of
the same role in
motion as the
in linear motion
depend on
body & radius

Moment of Inertia

Consider a
made up of
of small masses

m_1, m_2, m_3, \dots

distances r_1, r_2, \dots

The axis of rotation

al acceleration
angular

②
e get

side with 'r'

at $rF = \tau$ &
I

So $\tau = m r^2 \alpha$
 $\tau = I \alpha$

Significance:

Moment of Inertia plays
the same role in angular
motion as the mass plays
in linear motion & its
depend on mass of the
body & radius

Moment of Inertia of a rigid
body:

Consider a rigid body is
made up of 'n' number
of small masses say
' $m_1, m_2, m_3, \dots, m_n$ ', at
distances ' $r_1, r_2, r_3, \dots, r_n$ ' from
the axis of rotation say 'O' as
shown.

let the rig
rotating with
with an acc
So the mag
torque act
will be

Similarly $\tau_1 = m_1 r_1^2 \alpha$
 $\tau_2 = m_2 r_2^2 \alpha$
 \vdots
 $\tau_n = m_n r_n^2 \alpha$

Total torque a
will be

$\tau_T = \tau_1 + \tau_2 + \dots + \tau_n$
 $= m_1 r_1^2 \alpha + m_2 r_2^2 \alpha + \dots + m_n r_n^2 \alpha$

4

Let the rigid body be rotating with an angle ' θ ' with an acceleration ' α '. So the magnitude of the torque acting on each mass will be

Similarly,

$$\begin{aligned} \tau_1 &= m_1 r_1^2 \alpha \\ \tau_2 &= m_2 r_2^2 \alpha \\ &\vdots \\ \tau_n &= m_n r_n^2 \alpha \end{aligned}$$

Total torque acting on a body will be

$$\begin{aligned} \tau_T &= \tau_1 + \tau_2 + \tau_3 + \dots + \tau_n \\ &= m_1 r_1^2 \alpha + m_2 r_2^2 \alpha + \dots + m_n r_n^2 \alpha \end{aligned}$$

5

Since the body is rotating with same angular acceleration

$$\begin{aligned} \tau_T &= m_1 r_1^2 \alpha + \dots \\ &= \left[m_1 r_1^2 + \dots \right] \alpha \\ \tau_T &= \left[\sum_{i=1}^n m_i r_i^2 \right] \alpha \end{aligned}$$

So

$$\tau_T = I \alpha$$

be
angle ' θ '
' α '
the
each mass

5

Since the body is rotating with same angular acceleration ' α ' So

$$\tau_T = m_1 r_1^2 \alpha + m_2 r_2^2 \alpha + \dots + m_n r_n^2 \alpha$$

$$= [m_1 r_1^2 + m_2 r_2^2 + \dots + m_n r_n^2] \alpha$$

$$\tau_T = \left[\sum_{i=1}^n m_i r_i^2 \right] \alpha$$

$$\sum_{i=1}^n m_i r_i^2 = I$$

So

$$\tau_T = I \alpha$$

a body

+ τ_n

+ $m r^2 \alpha$

Angular Momentum:-

The cross product of linear momentum & the position vector ' \vec{r} ' about a reference axis is called angular momentum.
OR

The product of linear momentum & moment arm for momentum is called angular momentum.

• It is denoted by \vec{L} .

Mathematically:-

The angular momentum \vec{L} of a particle of mass ' m ' moving in a circular path with velocity \vec{v} is

$$\vec{L} = \vec{r} \times \vec{p} \Rightarrow rps \sin \theta \hat{n}$$

where \vec{r} is of the body & origin 'O'.

The magnitude of the angular momentum can

$$|\vec{L}| = rps \sin \theta$$

We know that

$$\vec{L} = rps \sin \theta \hat{n}$$

• where ' θ ' is

$$\vec{r} \text{ \& } \vec{p}$$

• \hat{n} is the unit vector

shows the direction

momentum \vec{L}

to the plane of

2

where \vec{r} is the position vector of the body with respect to origin 'O'.

The magnitude of the angular momentum can be found by

$$|L| = r p \sin \theta \rightarrow (1)$$

We know that

$$\vec{L} = r p \sin \theta \hat{n} \rightarrow (2)$$

where 'theta' is the angle b/w \vec{r} & \vec{p} .

\hat{n} is the unit vector which shows the direction of angular momentum \vec{L} , which is perpendicular to the plane containing \vec{r} & \vec{p} .

Unit of linear position vector
reference axis
angular momentum

of linear momentum arm
is called
momentum.

defined by \vec{L} .

angular momentum
of mass 'm'
circular path with

$$\vec{L} \Rightarrow r p \sin \theta \hat{n}$$

3

From eq (1)

$$L = r p \sin \theta$$

$$L = r(mv) \sin \theta$$

$$L = m v r \sin \theta$$

where v is the

the particle

(S.I.D) If a particle

with uniform

velocity 'w'

angle b/w

point will be

where \vec{v} is the

tangential velocity

So

$$L = m v r \sin \theta$$

$$= m v r \sin \theta$$

$$L = m v r$$

3

position vector

find by
①

angle b/w
②

vector which
of angular
which is perpendicular
aining \vec{r} & \vec{p} .

From eq ① we can write

$$L = r p \sin \theta$$

$$p = mv$$

$$L = r(mv) \sin \theta$$

$$L = mvr \sin \theta$$

where v is the velocity of

the particle

Prove $L = mvr$
 $L = I\omega$

(S12) • If a particle is moving
with uniform angular
velocity ' ω '. Then the
angle b/w \vec{r} & \vec{v} at every
point will be 90°

where \vec{v} is the
tangential velocity

So

$$L = mvr \sin \theta$$

$$\theta = 90^\circ$$

$$= mvr \sin 90^\circ$$

$$L = mvr$$

4

We know that

So

$$L = m(rv)$$

$$L = mr^2\omega$$

$$L = I\omega$$

• Its unit is

Angular Momentum

• Consider a

we know that

So

$$L = m(r\omega)r$$

$$L = mr^2\omega$$

$$v = r\omega$$

$$\therefore mr^2 = I$$

$$L = I\omega$$

• Its unit is $\text{kgm}^2 \text{s}^{-1}$ or J s

Angular Momentum of a rigid body :-

• Consider a rigid body rotating about a fixed axis through centre of mass.

• Rigid body consist of 'n' number of particle, which are also moving about a fixed axis so the angular momentum of each particle would be

$$L_1 = m_1 r_1^2 \omega$$

$$L_2 = m_2 r_2^2 \omega$$

$$L_n = m_n r_n^2 \omega$$

The total Angular momentum of all particles with angular

$$L_T = L_1 + L_2 + \dots$$

$$= m_1 r_1^2 \omega + m_2 r_2^2 \omega + \dots$$

$$= \left[m_1 r_1^2 + m_2 r_2^2 + \dots \right] \omega$$

$$L_T = \left[\sum_{i=1}^n m_i r_i^2 \right] \omega$$

$$L_T = I\omega$$

S

$$L_1 = m_1 r_1^2 \omega_1 \quad \text{Similarly}$$

$$L_2 = m_2 r_2^2 \omega_2$$

\vdots

$$L_n = m_n r_n^2 \omega_n$$

The total Angular Momentum of all particle which are moving with angular velocity ' ω '.

$$L_T = L_1 + L_2 + L_3 + \dots + L_n$$

$$= m_1 r_1^2 \omega + m_2 r_2^2 \omega + \dots + m_n r_n^2 \omega$$

$$= [m_1 r_1^2 + m_2 r_2^2 + \dots + m_n r_n^2] \omega$$

$$L_T = \left(\sum_{i=1}^n m_i r_i^2 \right) \omega$$

$$\sum_{i=1}^n m_i r_i^2 = I$$

Moment of Inertia

$$L_T = I \omega$$
